

Possible Further Impact for Participating in this Study

- This study may aid in further developing insight as to how to manage the therapeutic process when working with individual clients who also are autistic.
- This study may aid therapists in integrating how to modify their practice so that it is more conducive to the individual autistic's needs.
- This study may identify common obstacles that effect the development of the therapeutic process when working with individual clients who also are autistic.
- This study may help bridge some of the gaps between existing models of therapy and how they are implemented when working with individual clients who also are autistic.
- This study may encourage individual clients who also are autistic to make more use of psychotherapeutic services with regards support for their mental health and emotional wellbeing.
- This study may encourage a greater emphasis on joined up services between ASD treatment teams and psychotherapists/counsellors.
- This study may encourage parents/carers of individual clients who also are autistic to become trained in elements of psychotherapeutic intervention in supporting the individual who also is autistic.
- This study may be informative in providing quality research based data that could be used for future research in this area.
- This study may provide data to assist organisations in developing a specialised service when working with individual clients who also are autistic.
- This study may help in the development of broad outcomes that could facilitate in providing evidence in the assessment of services when working therapeutically with individual clients who also are autistic.
- This study may provide evidence to various insurance agencies in the support of provision of psychotherapeutic services to individual clients who also are autistic.
- This study may aid in the future development of relevant evidence based continuous professional development for training counsellors/psychotherapists in working therapeutically with individual clients who also are autistic.
- This study may aid in the future development of legislation and policy in providing evidence/lack of evidence for specific psychotherapeutic intervention in therapeutically working with individual clients who also are autistic.
